MONC Token is only Crypto allowed on the Monesave App for Payments. Monesave Token (MONC) is a next-generation utility token designed to bridge the gap between digital assets and real-world spending.

Integrated within the Monesave ecosystem, MONC empowers users with seamless, contactless payments through Payment Rings at shops, restaurants, and anywhere that accepts contactless transactions across the world.

Built on blockchain technology and governed by a Decentralized Autonomous Organization (DAO), MONC is redefining financial accessibility, savings, and decentralized decision-making.

The Vision

MONC aims to revolutionize everyday spending by integrating cryptocurrency into the physical economy. The token is not just a store of value but a medium of exchange, enabling users to tap and pay effortlessly while promoting financial responsibility and digital asset adoption.

3. About MONC Tokens

What is MONC?

MONC is the only Crypto token allowed on the Monesave Payment Ring. The MONC Tokens allows users top up their Monesave Smart Payment Rings to spend anywhere!

How MONC Token Increases in Value

Monesave Token will increase in value as more users buy the [Monesave Payment Rings](#). In addition, the value of MONC tokens is designed to increase over time through strategic mechanisms, including:

- **Increased Adoption:** Payment with Rings are more convenient than Phones or Cards. Smart Rings are already taking off globally. As more users adopt Payment Rings for everyday transactions, demand naturally rises, pushing up Monc Token value.
- **Limited Supply:** With a fixed total supply, scarcity plays a role in enhancing the token's long-term value.
- **Real-Time Spending Power:** Since users can immediately spend MONC, any price increase instantly translates to increased purchasing power.
- **Merchant Demand:** Businesses accepting MONC benefit from reduced transaction fees and exclusive rewards, encouraging further adoption.

Token Burning Mechanism

To further support price stability and long-term value appreciation, Monesave will implement a **token burning** strategy where:

- A percentage of MONC used in transactions may be periodically burned to reduce supply.
- The DAO can vote to burn excess treasury holdings when necessary to drive price appreciation.
- Limited-time burn events can be introduced to create scarcity and incentivize holding.

Overview of Blockchain Infrastructure

MONC operates on a robust, secure, and scalable blockchain network designed to provide transparency, traceability, and security. Leveraging a decentralized ledger ensures that every transaction is immutable and verifiable, preventing fraud or manipulation.

Smart Contracts and Security Features

MONC utilizes smart contracts to automate various processes, such as the issuance, redemption, and transfer of tokens. These smart contracts are designed to be highly secure and transparent, ensuring that all terms are fulfilled without the need for intermediaries.

Compliance with Blockchain Standards

MONC is fully compliant with ERC-20 and industry-standard blockchain protocols to ensure interoperability with major decentralized finance (DeFi) platforms, exchanges, and wallets. This compliance ensures broad accessibility and usage of MONC across multiple ecosystems.

MONC Wallets and Supported Platforms

MONC can be stored and transacted using a variety of popular digital wallets, offering flexibility for users. Wallets supporting ERC-20 and similar standards will be able to store and transfer MONC, giving users full control over their assets.

Because MONC follows the standard ERC-20 protocol, many Ethereum-supporting exchanges and wallet applications already have built-in support for viewing and transferring MONC.

The benefits of building on Ethereum and ERC-20 include:

- The security and availability guarantees of one of the largest global blockchain networks (Ethereum) and its proof-of-work model;
- A simple and familiar smart-contract pattern;
- Publicly verifiable token supply, account balances, and on-chain procedures;
- Ability to integrate with other smart contract applications like distributed exchanges, distributed apps, and swap contracts;
- Broad adoption by crypto stakeholders such as exchanges, crypto asset organizations, institutional investors and retail users;
- Reduced dependency on any single authority due to decentralization; and
- Access to a broad market that includes all individuals with an internet connection.

MONC is only available on Ethereum today, but it may also be launched on other chains in the future if there are compelling benefits.

The Ethereum contract address is 0x6415595bafC1761e6f118FbF6aAb4E92d86532d8
